

A -- SuSiE-RSS credible-set yield as a function of LD-reference overlap

All 60 EUR real-LD region x trait fits with `ld_overlap_fraction`; reference at Benner 2017 0.5 calibration threshold

B -- QTL-coloc PP.H4 as a function of GWAS-side LD-reference overlap

32 successful QTL-coloc attempts (status = success); $x = \text{MIN } \text{ld_overlap_fraction}$ across 5 trait fits at the same region x ancestry cell

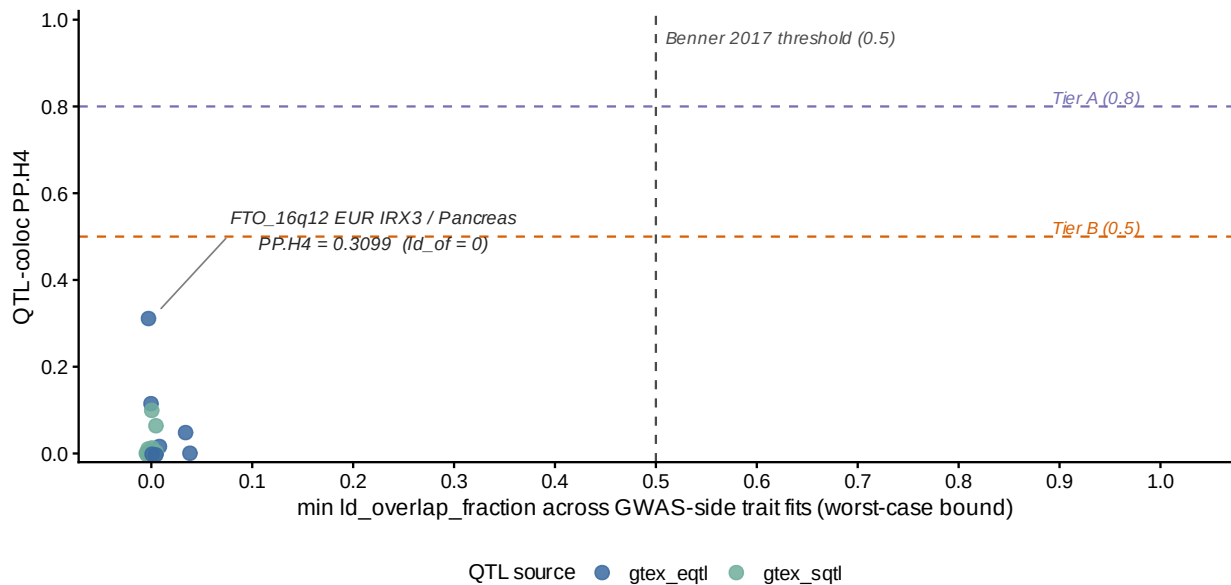

Figure H3. LD-reference-quality dose-response on coloc inference at admissible TrackA loci.

Panel A -- SuSiE-RSS credible-set yield x `ld_overlap_fraction`. Each point = one EUR (region, trait) SuSiE-RSS fit ($n = 60$). The 36 AFR fits are excluded because

Panel B -- QTL-coloc PP.H4 x GWAS-side `ld_overlap_fraction`. Each point = one successful (region, gene, tissue, qtl_source) QTL-coloc attempt ($n = 32$, all EUR)
