

SH2B3 12q24 (asthma, EUR) - flagship

Identity-LD Stage 1: PP.H4 = 1.00 at canonical leads rs3184504 / rs10774625 (BMI-HTN, HTN-stroke).

Stage 2 real-LD: n_cs_a = 0 at those trait pairs (locus collapse).

Shown: asthma x EUR (only non-collapsed real-LD CS at this region).

FTO 16q12 (BMI, EUR) - rescued Tier C

Tier C leader: PP.H4 = 0.3099 for IIRX3 / Pancreas (GTEx eQTL).

Real-LD overlap exceeded threshold (limitation; SuSiE fell back toward identity-like internal structure). Top-5 CS by pip-sum labelled.

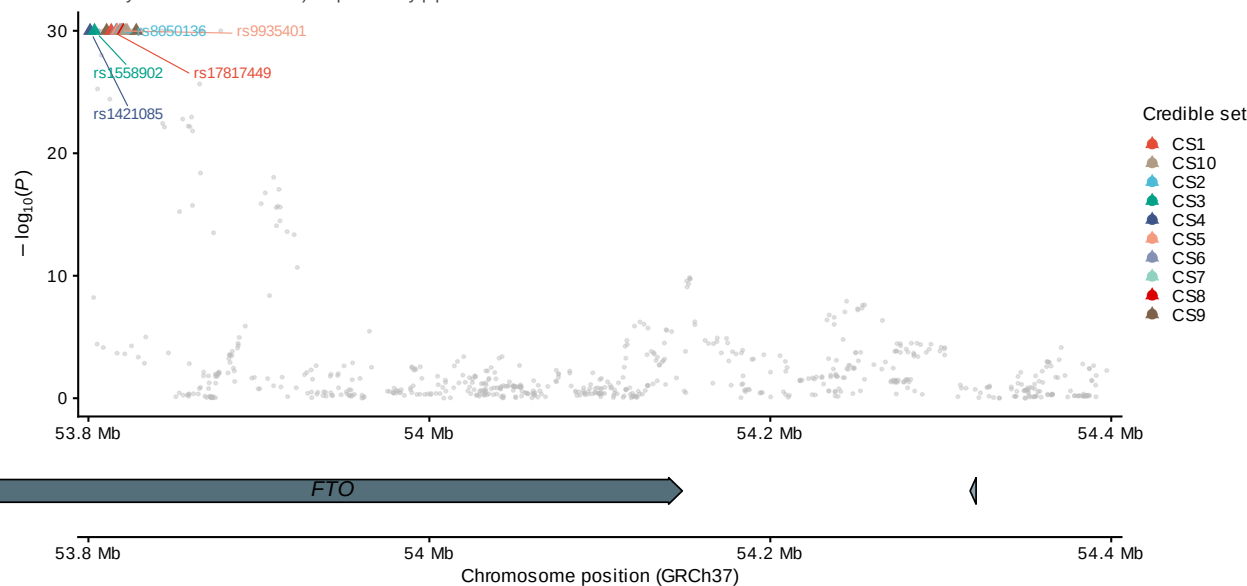

Figure 1B. Regional CS-membership panels at two anchor loci. Points coloured by SuSiE-RSS credible-set assignment; grey = non-CS. Filled triangles mark variants with $-\log_{10}(P) > 30$ (y-capped). GRCh37 coordinates; gene models from MAGMA NCBI37.3.gene.loc. Source: results/fine_mapping/susie/ (Stage 2 real-LD). Identity-LD per-SNP overlay deferred to post-k2d-fire revision.
